

## PORTABLE DEVICE FOR TRANSPORTING A SPOOL OF CABLE

### ABSTRACT

A portable device for transporting a spool of cable includes a stationary handle and a movable handle movable between raised and lowered positions. The invention further includes a housing positionable into a spool opening. The housing has pistons mounted within it and has apertures formed around the pistons. Advantageously, latching members are connected to the pistons and are movable between retracted and extended positions through a plurality of corresponding apertures as the movable handle is lowered and raised. The plurality of pistons engage a spool opening and allow an operator to lift a spool and transport it while the movable handle is at a raised position. The latching members are disengageable from a spool when the movable handle is released to a lowered position.
